

Fiber Optic 86 Wireless Panel

Overview

This product has acquired the relevant product qualification (s)/license (s) of certain applicable country/countries. View more.

Key Takeaways

A Fiber Optic 86 Wireless Panel typically refers to either a wall-mounted fiber optic faceplate for indoor connectivity or a wireless smart wall panel, each serving distinct networking or home automation purposes. Fiber Optic 86 Wall Panel

A fiber optic 86 wall panel is an indoor, wall-mounted faceplate designed to terminate and manage fiber optic cables, usually supporting 2 cores or more, with SC or LC connectors. These panels are commonly used in FTTH (Fiber to the Home) installations, data centers, and enterprise networks to provide neat, organized, and secure fiber connections. Key features include:

- Compact 86-type size compatible with standard wall boxes.
- Indoor mounting for residential or office environments.
- Support for SC/LC connectors and fiber patch cords.
- High-quality manufacturing with pre-production testing to ensure reliability.
- Applications include fiber termination, patching, and distribution in structured cabling systems.

Wireless 86 Wall Panel

An 86 wireless panel is a smart RF wall switch that fits the same 86-type wall box but operates wirelessly, often using 433 MHz RF or Wi-Fi for home automation . These panels can control lights, lamps, or other devices remotely and may include:

- 1/2/3 gang configurations for multiple circuits.
- Remote control compatibility for convenience.
- Integration with smart home systems for automation.
- PoE wireless access points in some models, providing network connectivity at 750 Mbps while fitting the 86 panel form factor .

Key Differences	Feature	Fiber Optic 86 Panel	Wireless 86 Panel	Function
termination and patching	Wireless control of devices or network			
access	Connectivity	SC/LC fiber connectors	RF 433 MHz, Wi-Fi, or PoE	Use Case
centers, FTTH, enterprise networks	Smart homes, IoT devices, wireless access			Data
points	Installation	Indoor wall-mounted, structured cabling	Indoor wall-mounted, plug-and-play or remote-controlled	Summary

While both products share the 86 wall panel form factor, their purposes differ significantly. Fiber optic panels focus on structured cabling and high-speed data transmission, whereas wireless panels provide smart control or network access in residential or commercial environments. Choosing the right panel depends on whether the priority is fiber connectivity or wireless automation/networking .
