

Gateway Fiber Optic Interface

Overview

Fiber gateways are all-in-one devices used in Active Ethernet deployments based on FTTH (Fiber-To-The-Home) access.

Key Takeaways

The fiber optic interface on a gateway is typically located on the back of the device, where the Optical Network Terminal (ONT) or integrated fiber port receives the fiber cable.

Location and Identification

In a standard fiber-optic setup, the fiber cable from your ISP connects to an Optical Network Terminal (ONT), which may be a separate device or integrated into your gateway (often called a Router Mode ONU). On a combined gateway/ONT device, the fiber port is usually labeled “Fiber,” “Optical,” or “WAN” and is located on the back panel of the unit. This port is designed to accept the fiber-optic connector, which is smaller and different from standard Ethernet ports.

Function of the Fiber Interface

The fiber interface converts light signals from the fiber-optic line into electrical signals that the gateway can distribute to your home network via Ethernet or Wi-Fi. This interface is essential for high-speed fiber internet, as it bridges the ISP's optical network and your local devices. In some setups, the ONT portion of the gateway also handles phone or TV services if bundled.

Connection Tips

- Ensure the fiber connector is securely plugged into the designated fiber port.
- Avoid bending the fiber cable sharply, as it can damage the delicate glass strands.
- If your gateway is separate from the ONT, the fiber connects to the ONT first, and then an Ethernet cable links the ONT to the gateway .
- The gateway's Ethernet ports are used to connect computers, switches, or other devices, not the fiber directly unless it is a combined ONU/gateway unit .

By locating the fiber port on the back of your gateway or ONT, you can ensure proper connection and optimal performance for your fiber-optic internet service.
