

Industrial power distribution boxes should be grounded

Overview

Each DISTRIBUTION BOX and controller must be grounded. On the US market, a 5.26 mm 2 (10 AWG) ground wire must be used, and in all other markets a 6 mm 2 must be used.

Key Takeaways

26 mm 2 (10 AWG) ground wire must be used, and in all other markets a 6 mm 2 must be used. The National Electric Code (NEC), Article 250, contains specific requirements on the grounding of electrical power systems and equipment. Each DISTRIBUTION BOX and controller must be grounded. With OSHA citations for electrical violations reaching record highs and equipment becoming increasingly sensitive to power quality issues. There are several factors that make substation grounding absolutely necessary. This helps to reduce the potential difference that exists between. Industrial plants typically use three primary types of grounding systems: Dirty Grounds: Dirty ground inside a facility are typically 120VAC, 220VAC or 480VAC power grounds that are associated with high-current loads, such as MCCs. The recommended practices in this document are intended to provide explanations of how electrical systems operate. It can also be an aid to all engineers responsible for the.
