

Is the pigtail fiber single-core or double-core

Overview

Fiber Optic Pigtails Explained: Types, Uses, and Benefits Single-mode pigtails use a small fiber core, usually around 9 microns, that carries a single light.

Key Takeaways

Fiber optic pigtails can be either single-core (single-fiber) or dual-core (two fibers), with single-core being the most common. Core Count of Pigtails

A fiber optic pigtail is a short optical fiber with a factory-terminated connector on one end and a bare fiber on the other, designed for splicing into a larger fiber cable system . Pigtails are available in various fiber counts:

- Single-core (single-fiber) pigtails: The most common type, featuring one fiber and one connector, typically used for standard network terminations .
- Dual-core (duplex) pigtails: Contain two fibers and two connectors, often marked “A” and “B” or with different colored boots to indicate polarity, suitable for bidirectional communication .
- Multi-core pigtails: Available in 4, 6, 12, 24, or more fibers, often in ribbon format for high-density splicing .

Single-Mode vs. Multi-Mode

Pigtails are also classified by fiber type:

- Single-mode pigtails: Yellow jacket, 9/125 µm core, support long-distance transmission with minimal signal loss .

- Multi-mode pigtails: Orange or aqua jacket, 50/125 µm or 62.5/125 µm core, suitable for short-distance applications like within buildings or campuses .

Practical Considerations

- Simplex pigtails: Single fiber, one connector, ideal for standard terminations.

- Duplex pigtails: Two fibers, two connectors, used for full-duplex communication.

- Splicing: Pigtails are typically fusion or mechanically spliced to the main fiber cable, ensuring low insertion loss and high reliability . In summary, while most fiber optic pigtails are single-core, dual-core (duplex) and multi-core options exist to meet different network requirements, and the choice depends on the application, fiber type, and desired connectivity.
