

Optical modules that do not require connection to a switch

Overview

Browse all Logitech products. Award-winning, beautifully designed peripherals for everyone at work, home, and school.

Key Takeaways

Bidirectional (BiDi) optical modules and certain point-to-point transceivers can operate without a switch, enabling direct device-to-device optical communication. Standalone Optical Modules

Optical modules are primarily designed to convert electrical signals into optical signals and vice versa, typically connecting network devices like switches, routers, or servers via fiber optic cables. However, some modules can function without a switch:

- **Bidirectional (BiDi) Modules:** These modules use a single fiber for both transmitting and receiving data by employing two different wavelengths. This allows direct connections between two devices without requiring a switch or router in between. BiDi modules are available in both single-mode and multi-mode variants, supporting distances from a few meters to over 100 kilometers depending on the fiber type and module specifications.

- **Point-to-Point Optical Transceivers:** Certain SFP, SFP+, or QSFP modules can be used in a direct fiber link between two devices, such as servers or storage systems, bypassing network switches. These setups are often used in high-speed data replication, testing environments, or private optical links .

Considerations for Standalone Use

- **Compatibility:** Ensure the module matches the device's optical port type and supports the required data rate (1G, 10G, 25G, 40G, 100G, etc.), .
- **Fiber Type:** Single-mode modules are suitable for long distances, while multi-mode modules are cost-effective for short-range connections .
- **Wavelength Matching:** For BiDi modules, the transmitting wavelength of one device must match the receiving wavelength of the other device.
- **Power and Monitoring:** Some modules include integrated laser control and photodiode monitoring, which helps maintain signal integrity in standalone setups .

Practical Applications

- Direct server-to-server connections for high-speed data transfer.
- Lab testing and optical experiments without deploying a full network infrastructure.
- Private optical links in data centers or campus networks where switch ports are limited. By selecting the appropriate BiDi or point-to-point optical module, you can establish a reliable optical link without a switch, maintaining high-speed communication and flexibility in deployment .
