

Production speed of molded cable trays

Overview

Cable Tray Roll Forming Machine Production speed during online punching: 2.5-5 meters/minute. Continuous molding speed of the molding Cable Tray Production.

Key Takeaways

Molded cable trays can be produced at speeds ranging from 2.5 to 40 meters per minute, depending on material, profile complexity, and automation level. Roll Forming Production Speeds

Cable trays are commonly manufactured using roll forming lines, which allow continuous shaping of steel strips into tray profiles. Typical production speeds for roll forming vary based on material thickness and tray complexity:

- Continuous molding speed: 10-25 meters per minute for standard steel trays with thicknesses of 1-2.5 mm .
- High-volume production: 10-40 meters per minute, depending on profile complexity and material type .
- Online punching during forming: 2.5-5 meters per minute when holes or slots are punched simultaneously with forming .

Factors Affecting Production Speed

- Material Thickness: Thicker steel slows down forming and punching operations. Typical thickness ranges from 0.4 mm to 2.5 mm .

- Tray Profile Complexity: Simple ladder or channel trays can be produced faster, while trays with multiple bends, flanges, or perforations require slower speeds .

- Automation Level: Fully automated lines with servo feeding, CNC punching, and synchronized cutting achieve higher speeds and consistent quality compared to semi-automatic or manual setups .

- Secondary Operations: Press brake bending, flange forming, or fitting attachments may reduce overall throughput, as these steps are often performed after roll forming .

Typical Production Line Configuration

A standard cable tray production line includes:

- Uncoiler and leveling machine
- Servo feeding system for precise material control
- CNC punching unit for holes and slots
- Multi-stage roll forming machine
- Length cutting and stacking modules This setup allows continuous production with minimal downtime, and changing tray specifications typically requires adjusting rollers or dies, which can take 1-3 hours depending on preparation .

Summary

In practice, molded cable trays can be produced at 2.5-5 meters per minute during punching and 10-40 meters per minute for continuous roll forming, with actual speed influenced by material thickness, tray design, and automation level. Fully automated lines with intelligent feeding and CNC control maximize throughput while maintaining precision and quality .
