

## Tubular busbar bending

### Overview

Busbar bending is the process of shaping copper or aluminum busbars into the required angles and forms for use in electrical panels, switchgear, transformers, and power distribution systems. Manual busbar bending is a traditional method that involves using hand tools or manual bending machines to shape busbars. While it may not offer the precision or efficiency of automated techniques, manual bending is still widely used, especially in smaller-scale projects or when working with. Fast, precise, ergonomic bending, punching and cutting of copper and aluminium busbars. Simple, flexible handling is guaranteed with static units for busbar machining CW 120-S and the mobile copper workstation CW 120-M. Explore the essential guidelines and best practices to enhance your understanding and implementation of busbar fabrication.
